### **DETAILED ACTION**

#### Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 5/31/11 has been entered. Claims 1, 3-8, and 10-18 are currently pending.

# Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1, 3-8, and 10-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Beer (US patent 3,711,385; as provided in Applicant's IDS of 9/28/06, hereafter Beer) in view of Bestaoui et al ("A Chimie Douce Route to Pure Iridium Oxide" Chem. Mater. 1997 9. pg 1036-1041; hereafter Bestaoui) and Brode et al (US patent 4,579,942; hereafter Brode).

Claim 18: Beer teaches a process comprising preparing colloidal iridium oxide (see, for example, abstract, col 2 lines 20 - 42, and col 11 lines 50 - 65) by a process comprising;

Art Unit: 1712

forming an aqueous solution of an Ir salt and admixing with a Bronsted base (NaOH) to produce a mixture, and coating a colloidal iridium oxide, and other platinum group oxides onto a surface (see, for example, col 2 lines 20 - 42, col 7 lines 25 - 42, and col 11 lines 50 – 65). Beer is silent as to the specific reaction conditions, so Beer does not explicitly teach adjusting the pH to >12 or stirring the mixture at a temperature from 0 to 100°C over a period of from 3 to 72 hours. Bestaoui teaches a method of forming colloidal iridium oxide from the reactants comprising an iridium salt, water, and an alkali hydroxide (see, for example, abstract, and pg 1037-1040). Bestaoui further teaches wherein the pH of the salt / water / hydroxide solution is adjusted to about 12 (see, for example, pg 1038-1039, and Fig 3). And Bestaoui further teaches that pH is a result effective variable influencing the rate of hydrolysis (see, for example, pg 1037 -1039, and Fig 2 and 3). Bestaoui further teaches that the colloidal iridium oxide can predictably be synthesized by holding the reactants including the salt, water and hydroxide at room temperature for 24 hours (see, for example, abstract, pg 1039, III.2). As both Beer and Bestaoui teach methods for forming colloidal iridium oxide from precursors comprising, an iridium salt, water, and alkali hydroxides, it would have been obvious to one of ordinary skill in the art at the time of invention to have incorporated the reaction conditions taught by Bestaoui into Beer in order to achieve the predictable result of forming iridium oxide and when a primary reference is silent as to a certain detail, one of ordinary skill would be motivated to consult a secondary reference which satisfies the deficiencies of the primary reference. Although the adjustment of the pH to about 12 is not explicitly >12, it would have been obvious to one of ordinary skill in the

art at the time of invention to have incorporated a pH > 12 since about 12 would include slightly lower or higher than 12 and these overlap the range of >12. In the case where the claimed ranges "overlap or lie inside ranges disclosed by the prior art" a *prima facie* case of obviousness exists. In re Wertheim, 541 F.2d 257, 191 USPQ 90 (CCPA 1976).

Beer in view of Bestaoui does not explicitly teach stirring during the room temperature mixture holding step. The examiner asserts, that it is well known in the art that stirring of a mixture encourages a more complete reaction and a more homogeneous product (see, for example, Brode col 9 lines 51-53). Therefore it would have been obvious to one of ordinary skill in the art at the time of invention to have applied stirring during the holding process comprising the mixture of salt, water, and hydroxide taught by Beer in view of Bestaoui as it would predictably encourages a more complete reaction and a more homogeneous product.

Claim 1: Beer in view of Bestaoui and Brode teach the method of claim 18 (described above) wherein Beer further teaches applying colloidal platinum group oxides (such as iridium oxide) to a surface to yield a coated surface (see, for example, col 2 lines 20 - 43, col 3 line 66 – col 4 line 17, col 7 lines 25 - 65, and col 11 lines 50 - 75). Beer further teaches drying the coated surface and firing the coated surface at a temperature of at least 460°C (see, for example, col 7 lines 25 - 35). Although a temperature of at least 460°C is not explicitly the claimed range of 300 to 1000°C, it would have been obvious to one of ordinary skill in the art at the time of invention to have incorporated a temperature within this range since in the case where the claimed ranges "overlap or lie inside ranges disclosed by the prior art" a *prima facie* case of

obviousness exists. In re Wertheim, 541 F.2d 257, 191 USPQ 90 (CCPA 1976). With respect to the remaining limitation of repeating the coating operation until a desired thickness is achieved this limitation is recited as optional, so it is not required to be taught by the prior art.

Claims 3 and 10: Beer in view of Bestaoui and Brode teach the method of claim 18 (described above) wherein Beer has further taught NaOH as the Bronsted base.

Claim 4: Beer in view of Bestaoui and Brode teach the method of claim 18 (described above, including the pH limitation) wherein Beer has further taught an aqueous solution of Ir salt is used (see, for example, col 11 lines 54 – 56).

Claim 5, 12, and 13: Beer in view of Bestaoui and Brode teach the method of claim 18 (described above) wherein Bestaoui has taught IrCl<sub>3</sub>\*H<sub>2</sub>O and alkali metaliridium salts such as Na<sub>2</sub>IrCl<sub>2</sub> as the Ir salt (see, for example, pg 1037-1039).

Claims 6, 7, and 14: Beer in view of Bestaoui and Brode teach the method of claim 18 (described above) wherein Beer further teaches the surface being coated is a Ti electrode (See, for example, col 3 lines 1 – 19).

Claims 8 and 16: Beer in view of Bestaoui and Brode teach the method of claim 18 (described above) wherein Beer further teaches that the electric conductivity of the platinum group oxides of relatively thin layers has been found to be virtually equal to that of the corresponding metals, while providing superior chemical resistance (see, for example, col 2 lines 13 - 20). So achieving thin layers is desirable to the method of Beer. Beer is silent as to the particle size produced, so Beer in view of Bestaoui and Brode do not explicitly teach wherein the colloidal iridium oxide produced has a particle

Art Unit: 1712

size of less than or equal to 10nm or further less than or equal to 3nm, but the examiner asserts that such claimed particle sizes would be inherent to the process taught by Beer in view of Bestaoui and Brode since the prior art have taught a method comprising the same starting materials (such as water, IrCl<sub>3</sub>H<sub>2</sub>O, and NaOH), and overlapping pH's and temperatures as the claimed method. Where the claimed and prior art products are identical or substantially identical in structure or composition, or are produced by identical or substantially identical processes, a prima facie case of obviousness has been established, In re Best, 195 USPQ 430, 433 (CCPA 1977). Further "When the PTO shows a sound basis for believing that the products of the applicant and the prior art are the same, the applicant has the burden of showing that they are not" In re Spada, 15 USPQ2d 1655 1658 (Fed Cir. 1990). Here the sound basis for believing that the products of the applicant and the prior art are the same is the provision of the same claimed materials and process steps. Alternatively, as the particle size produced influences the level to which the layer thickness can be reduced, the particle size is a result effective variable, so it would have been obvious to one of ordinary skill in the art at the time of invention to have incorporated a particle size with the claimed ranges since it has been held that where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art. In re Aller, 220 F.2d 454, 456, 105 USPQ 233, 235 (CCPA 1955).

Claims 11 and 17: Beer in view of Bestaoui and Brode teach the method of claims 4 and 18 (described above) wherein Bestaoui further teaches the pH of the salt / water / hydroxide solution is adjusted to about 12 (see, for example, pg 1038-1039, and

Art Unit: 1712

Fig 3). And Bestaoui further teaches that pH is a result effective variable influencing the rate of hydrolysis (see, for example, pg 1037 - 1039, and Fig 2 and 3). Although the adjustment of the pH to about 12 is not explicitly >13, it would have been obvious to one of ordinary skill in the art at the time of invention to have incorporated a pH > 13 since it has been held that discovering an optimum value of a result effective variable involves only routine skill in the art. *In re Boesch*, 617 F.2d 272, 205 USPQ 215 (CCPA 1980)

Claim 15: Beer in view of Bestaoui and Brode teach the method of claim 7 (described above) wherein Beer further teaches the Ti electrode is an electrode for the evolution of oxygen and chlorine (see, for example, abstract, col 1 lines 30 – 39), and col 3 lines 11 - 19).

# Response to Arguments

Applicant's amendment adding the limitation requiring the preparation of colloidal iridium oxide to be absent of an added stabilizer and supporting arguments directed against the loroi reference, filed 5/31/11, have been fully considered and are persuasive with respect to the rejections previously relying upon loroi. Therefore, the rejection has been withdrawn. However, upon further consideration, a new ground(s) of rejection is made over Beer in view of Bestaoui and Brode as described above.

#### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to NATHAN EMPIE whose telephone number is (571)270-1886. The examiner can normally be reached on M-F, 6:30- 4:00 EST.

Application/Control Number: 10/599,434 Page 8

Art Unit: 1712

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Michael Cleveland can be reached on (571) 272-1418. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
